Testosterone propionate

Dosage

Testosterone propionate is intended for solo courses without supplementing with other compounds. If the athlete encounters anabolic for the first time and his goal is to build muscle mass – it is recommended to stop at a norm of 50 mg. It must be administered 1 time in 2 days. The cycle of admission lasts 6 weeks, at the end of which it is required to do rehabilitation treatment. For women, the dosage is half as much – 25 mg once every 3-4 days. The norm can be increased to 50 mg, provided that there are no adverse reactions.

Side effects

Potential abnormalities that occur against the background of the subcutaneous injection of the male hormone:

- frequent erection;
- increased libido;
- development of a woman's body according to the male type (masculinization);
- atrophy and ailments of the mammary (breast) glands;
- swelling of the face;
- untimely excretion of water and salt from the body;
- tendency to the formation of thrombosis;
- cramps, muscle pain, depression and apathy;
- allergic reactions are possible;
- intensive weight gain (with frequent injections);
- excessive sweating.

Reception effects

1. The growth of muscle mass.
2. The exclusion of body fat.
3. The formation of muscle relief and hardness.
4. Active growth of power.
5. At the time of the cycle of taking the drug – an increase in libido and its decrease after graduation.
6. The probability of diseases of the cardiovascular system is reduced.
